(a) KL to Truth vs County Count
US states (real county counts)
DC: $n = 1$ county (KL = 0, natural control)
Log-linear fit ($r = 0.54$, $\rho = 0.51$)
Texas
Alaska
Georgia
Virginia
Kentucky
Delaware
Pearson $r = 0.54$
Spearman $\rho = 0.51$
$p < 10^{-10}$
Mean KL-divergence (Dirichlet sample || true distribution)
Number of counties (disaggregation dimensionality)
(b) Rashomon Diameter vs Distribution Entropy
US states
DC: $H = 0$, pairwise KL = 0
Linear fit ($\rho = 0.63$)
Alaska
Kentucky
Georgia
Virginia
Delaware
Spearman $\rho = 0.63$
$p = 8.75e - 07$
Mean pairwise KL (Rashomon set diameter)
Distribution entropy $H(p)$ (nats)
