Rashomon Entropy vs Macrostate
$N = 10$
$N = 20$
$N = 50$
$S_R = k_B \ln \Omega$
(Boltzmann entropy)
Rashomon entropy $S_R(k) = \ln \Omega(k)$
Macrostate fraction k/N

Faithfulness Decays Exponentially
with Rashomon Entropy
Faithfulness $\propto e^{-S_R}$
$N = 10$
$N = 20$
$N = 50$
Theory: e^{-S_R}
Max achievable faithfulness $1/\Omega$
